Open the Crack file. Open the downloaded folder and extract the file. That's all, enjoy. Q: Display certain default items when nothing is found on a search I have a 'content' model which contains a 'title' and a 'body' field, both of which are unique and indexed. I'm using Elasticsearch for this. I'm looking for a query that would return all of the 'content' objects that have no title, and then if nothing is found for that filter, also return all of the 'content' objects that have no body. Right now, I have a query like the following, which does return all of the content that has no title: curl -XGET 'localhost:9200/_search?pretty' -d ' { "size": 100, "query": { "match_all": {} }, "filter": { "and": { "filters": [{ "term": { "title.keyword": "" } }, { "term": { "body.keyword": "" } }] } } } ' However, I need to do a second search for all of the content that has no body. What I need to do is to wrap the above in another filter, and then set the body field as not_analyzed. What is the proper way to do this? Do I have to combine these two queries in a new query? A: You can use the or filter here to specify multiple filter conditions, you can use the terms filter or query_string to have elasticsearch handle the wildcard. { "size": 100, "query": { "or": [
